Description	Supervisor:リム 勇仁, 情報科学研究科, 博士

氏名	NAUSHIN NOWER		
学位の種類	博士(情報科学)		
学位記番号	博情第 314 号		
学位授与年月日	平成 27 年 3 月 20 日		
論文題目	Data Recovery Schemes for Cyber-physical Systems with Incomplete Feedback (不完全なフィードバックを持つサイバーフィジカルシステムのためのデータ復元スキーム)		
論文審査委員	主査	リム 勇仁	北陸先端科学技術大学院大学 准教授
		丹 康雄	同 教授
		金子 峰雄	同 教授
		鵜木 祐史	同 准教授
		張 兵	情報通信研究機構 主任研究員

論文の内容の要旨

Now-a-days real-time systems have been intensively explored by the research community around the world due to many future technologies require real-time processing. Enormous efforts have been made on the upcoming technologies such as Internet of Things (IoT), Machine-to-machine (M2M), Cyber-Physical systems (CPS), Big data etc. These new technologies rely on wireless sensor and actuator networks (WSAN) as a communication media to perform real-time control and communication. However, by using WSAN, the point-to-multipoint mode of communication cannot guarantee reliable and real-time communication. Thus unreliable communication severely degrades the overall system performance and as well as it can affect the control and computation of the real-time system. To ensure real-time and guaranteed communication for point-to-multipoint configuration, data recovery scheme is needed. One of the examples of real-time point-to-multipoint systems is CPS, which enable orchestrating networked computational resources with physical systems. Moreover, CPS have many benefits over conventional network control system in terms of network integration and scalability point of view and also attract attention in a variety of different areas such as smart grid, health care, intelligent transportation, etc.

CPS enable the virtual world to interact with the physical world in order to monitor and control the intended parameter in real-time basis through the feedback control loop. Thus, the proper timing and accuracy of feedback data is very important for the interaction between the cyber and the physical world. Therefore a data recovery scheme is designed to ensure uninterrupted control in CPS.

This dissertation concerns research of technological issues for analysis of data, design and evaluation of a

data recovery algorithm and error minimization from the recovered data. The overall objective of this dissertation is to develop a data recovery scheme, which provides quality of result in terms of efficiency and real-time.

In the data analysis part, the data patterns of various physical systems are investigated and a general classification is made according to the property such as data series with small variation, or large variation and/or repetition exist on the data series. To recover various patterns it is important to know the nature of their underlying property. To do this, a data pattern analyzer is proposed which is able to classify various data patterns, as a data pre-processing step. iHouse data and Intel Berkeley Research lab data are examined using the analyzer.

Some data series remain stable with small change time and some time it is highly correlated with space. Thus to recover this, a data recovery scheme, called Efficient spatial data recovery (ESDR) scheme is proposed. In this scheme, a recovery algorithm is presented with Pearson correlation coefficient (PCC) to efficiently solve the long consecutive missing data. The proposed scheme is evaluated on iHouse data. On the other hand some data patterns have a randomness and variation in its nature, which make a great challenge to maintain the real-time control whenever the data is lost. To handle these kind of data, an Efficient Temporal and Spatial Data Recovery (ETSDR) scheme is proposed. The proposed scheme consists of two phases. In the first phase, which is pre-processing step, the temporal model is identified for large variation data and determined the spatial effects of neighbors. Auto Regressive Integrated Moving Average (ARIMA) model is a very powerful model to identify the auto-correlated nature or trend of a data series. In the next phase, which is real-time/online, temporal model and spatial effect is utilized to recover missing data.

Moreover to improve the recovered data, Kalman filter is used to reduce the error from the model estimated data. The temporal model, generated from ARIMA has internal errors and the model parameters may not remain constant. Thus, to improve the accuracy of the estimated data, a Kalman filter is incorporated to reduce the error. Before that, the window for Kalman filter is fixed to determine the proper process noise co-variance in real-time. Numerical results reveal that the proposed ETSDR/EM are very promising regardless of the increment percentage of missing data in terms quality of result (QoR).

This proposed research can help the development of CPS applications by ensuring uninterrupted control.

Keywords: correlation, cyber-physical systems, data recovery, real-time, quality of result.

論文審査の結果の要旨

The Evaluation Committee recognizes that the research work presented in the dissertation is incomplete feedback, in the exploration of data recovery schemes for the domain of cyber-physical systems (CPS). Naushin Nower focuses on the feedback missing data of the CPS and has reached a very good competence with clear vision and objectives of her research work. The dissertation divides into three main parts: data analysis, data recovery schemes, and noise reduction and error minimization. In the data analysis part, the role of data pattern analyzer and the novel framework design and architecture of data recovery schemes are clearly specified with in-depth investigation. In the data recovery schemes part, a universal pattern based data recovery scheme is proposed. Pearson Correlation Coefficient (PCC) and ARIMA model are applied to deal with the spatial and temporal correlations, respectively. In the last part, Kalman filter is used for real-time data recovery with noise reduction and error minimization. Speech restoration method is introduced for speech enhancement application. Quality of result (QoR) parameter is performed to evaluate the real-time and reliable of the proposed scheme.

The Evaluation Committee identifies that the dissertation contains the appropriateness of the given literature backgrounds, the sufficient related research works, and the research methodologies for the simulation studies. Besides that, the simulation results are validated and extensively well-discussed to justify the appropriateness of the proposed schemes. Also the comparison of simulation results is presented in a very fair way. Moreover, the dissertation includes clear and specific conclusions and recommendations for future works. In addition, the references are appropriately presented in the dissertation.

The Evaluation Committee validates and confirms that the research works in each chapter of the dissertation have been disseminated to the three international conferences and two journals. In summary, the Evaluation Committee agrees that Naushin Nower did make excellent achievements and momentous contributions to the domain of cyber-physical systems, in particular the research topics of data recovery schemes for incomplete feedback. Moreover, the Evaluation Committee observe that she does not encounter any problem in explaining her research work because she speaks frequently in English and her ability in oral presentation is very high. She can provide a comprehensive answer clearly to the questions as well. In addition, this research work is an important step toward the real-time and reliable control of CPS in the wide range of application domains. Hereby, the Evaluation Committee concludes that she with no doubts deserves to obtain the doctoral degree (Information Science).
